

HOSPITAL & CLINICAL SOLUTIONS

A POWERFUL TOOL FOR **WOMEN-CENTRIC MATERNITY CARE**

MaternityAide

DELIVERING CLINICIAN AND WOMEN-CENTRIC MATERNITY CARE

While demand for women-centric, flexible maternity services is growing, providers of such services frequently struggle with capturing and viewing data in the field.

Data governance and security is a key challenge with midwives recording confidential clinical information in diaries and then entering that data into the electronic patient record (EPR) later, or requiring hospitals to hire clerks to rekey the data. Another major challenge for providers is flexible scheduling, for example, and the ability to adjust appointments based on urgent needs and changing schedules.

Dedalus MaternityAide is a mobile application designed to deliver a safer, more flexible maternity service to all pregnant women and new mothers, enabling midwives to enter information about the visit where and when required — whether online or offline. The solution removes many of the complexities community midwives face by giving them easy access to a woman's clinical information at the point of care and enabling notes from the visit to be entered into a mobile device and seamlessly uploaded to the EPR.

WHY DEDALUS?

- Healthcare providers around the world trust Dedalus to run their business-critical systems and infrastructure.
- Dedalus supports healthcare transformation by providing innovative, technology-enabled, agile health solutions that deliver better care for patients, better health for populations and lower per-capita healthcare costs.
- Globally, Dedalus systems support more than 100 million patient records.

A MODERN TOOL FOR MODERN MATERNITY SERVICES

Developed using the latest technology and standards, Dedalus MaternityAide uses application programming interfaces (APIs) to exchange information between systems, and it conforms to the latest Fast Healthcare Interoperability Resources (FHIR) standards. This technology enables the most up-to-date information about the mother-to-be or new mother to be shared safely and securely.

THE SOLUTION ENABLES:

- Personalised and safer care, focused on the needs of the mother and her baby, with the ability to enable care to be redirected in more urgent cases.
- Greater efficiency for midwives, providing them with key patient information at the point of care and a simple way to record information into the EPR.
- Greater scheduling flexibility for midwives, with the ability to download their diary for the next 6 weeks to see the patients they are visiting that day and plan future visits at the point of care.

KEY BENEFITS

- Ability to work offline, so midwives can continue entering information even when there is no internet connection and then synchronise data when a connection is available.
- Enhanced data interoperability, reducing the burden of data entry.
- Less time spent travelling to pick up and update records.
- Friendly user interface, allowing midwives to view a list of the day's visits, assess and plan future visits, and enter patient information quickly and easily through a touchscreen device.
- Reduced risk of data loss and governance issues, with patient information captured digitally at the point of care and updated into the EPR.

DEDALUS MATERNITYAIDE IN ACTION

Demand for maternity services has been growing along with greater expectations for personalised care. Increasingly, healthcare providers have been focused on delivering care that is women-centred, provides easier access to information and supports maternity services.

This mobile application equips busy midwives with the tools to support safer, more personalised care. It can improve the experience of women, including new mothers, by ensuring that the midwife has access to the latest information related to their care and they do not need to repeat critical information.

DEDALUS MATERNITYAIDE VALUE PROPOSITION

Delivering truly personalised care and improving the workflow for midwives is integral to improving the quality of care and productivity. Dedalus MaternityAide frees midwives from having to carry and keep track of paper records or duplicate their efforts when it comes to entering information about the pregnant or new mother. Furthermore, the application means clinical teams do not have to spend resources tracking and maintaining paper records from community visits.

VALUE DELIVERED

By simplifying how information is accessed, updated and shared, Dedalus MaternityAide can deliver a return on investment for trusts and other healthcare organisations, including:

- 1.5 hours a day saved from community midwives not having to return to their base to collect records and update the EPR.
- Significant time saving in data entry.
- Reduced “no access” visits in community midwifery as a result of being able to schedule appointments alongside the mother.
